Re: Estate of Danny Tyson Wright

Dear Mr. Bond:

At your request, I have reviewed the following material pertaining to the death of Danny Tyson Wright:

1. Autopsy report for Danny Tyson Wright by Fleming Castillo Alfaro, 5 pages;
2. Witness statement of Captain David Walton, 2 pages;
3. Witness statement of Marco Henrique Williams, 2 pages;
4. Witness statement of Edward McCarty, 1 page.

History

According to the witness statements, Danny Wright had put some fish in a bucket to be given to some people. Another crew member, Kevin Charles Dillon, also called Jerome, threw the bucket and fish over the side of the boat. Danny and Jerome began arguing about this and Jerome took out a knife and stabbed Danny in the left side of his head. Jerome tried stabbing Danny more times, with Danny trying to avoid the knife. Eventually, Jerome stabbed Danny in the left side of his body after which Danny stumbled and collapsed. A large amount of blood was seen to come from the chest stab wound. A crew member called 911, but Danny had stopped breathing by the time the paramedics arrived.

Autopsy

The autopsy report describes three stab wounds. One was in the left side of the head in front of the ear and went down to the underlying jaw bone. A second was in the left side of the body below the ribcage and went through the diaphragm and into the left side of the heart. This resulted in internal bleeding into the left chest cavity. A third was in the left side of the

Thomas M. Bond, Esq.

November 9, 2005

body, 20 inches below the second wound and more towards the back. This wound cut skin and muscle.

Cause of Death

It is my opinion, within reasonable medical certainty, that the cause of death for Danny Tyson Wright was internal and external bleeding due to a stab wound of the heart.

Basis for Opinion on Cause of Death

The wounds other than the second described one above did not strike vital organs or cause a great deal of bleeding. The wound to the heart caused almost all the bleeding and would have been fatal if taken alone.

Period of Consciousness

It is my opinion, within reasonable medical certainty, that Danny Tyson Wright was conscious for at least five minutes after first being stabbed in the head until he lost consciousness due to loss of blood.

Basis for Opinion on Period of Consciousness

Mr. Wright lost consciousness due to hemorrhagic shock, which is a drop in blood pressure due to loss of circulating blood. Mr. Wright was certainly conscious from the time he was first stabbed in the head. He remained conscious while warding off Jerome's attempts to stab him. It is not clear which stab wound came first, the second or third, lower, wound, but Mr. Wright would have certainly been conscious and standing for each of those. His heart continued to beat after being cut as shown by his bleeding internally as evidenced by blood in his chest cavity as described in the autopsy. He would therefore have remained conscious while bleeding internally and externally after being stabbed in his heart. He would have to have lost over a pint of blood before losing consciousness, as this is the amount ordinary donated without loss of consciousness. I estimate the total time from the first stabbing plus the period of avoiding Jerome plus the period of bleeding while conscious after being stabbed in the heart to be at least five minutes.

Conscious Pain and Suffering

It is my opinion, within reasonable medical certainty, that Danny Tyson Wright suffered severe sharp pain in the left side of his face and jaw and his left lower chest and left flank resulting from the stab wounds in those locations. It is also my opinion, within reasonable medical certainty, that he suffered extreme anxiety and fear as he fought for his life with a knife wielding attacker. It is also my opinion, within reasonable medical certainty, that he suffered increasing air hunger as his left chest cavity filled with blood, compressing his left lung and depriving him of a large quantity of blood. This air hunger resulted in increasing anxiety and effort to increase breathing as the level of oxygen supplied to the brain decreased.

Thomas M. Bond, Esq.

November 9, 2005

Increased breathing would result in increased movement of the injured left side of the diaphragm, which resulted in more sharp pain.

Thus, Danny Tyson Wright lost consciousness experiencing severe sharp pain in his face and side along with severe fear and anxiety caused by his situation and injuries.

Basis for Opinion on Pain and Suffering

The face is supplied with a very large number of nerve endings sensitive to pain and a cut on the face results in severe pain. Severe pain also results from injury to the jaw bone whose surface also contains such nerves. Cutting the skin and muscles of the side of the body also leads to severe sharp pain.

Air hunger is a feeling experienced when the brain is deprived of oxygen consisting of involuntary effort to increase respiration, panic and anxiety leading to an effort to get more air. This feeling increases with decreasing oxygen level.

Evidence of Intent

The placement of the stab wounds in Mr. Wright's face and left side indicates an effort on the part of Jerome to inflict a mortal injury. The size of the knife witnessed to be used was sufficient to reach the victim's heart, also evidence of a foreseeable outcome of such stabbing. The multiple stab wounds against an unarmed victim also indicate intent to kill.

Sincerely,

Donald Jason, MD, JD
